

TIMEORA

by Tiemio

Product & Platform Documentation

Landing Page • Authentication • Company Admin • Staff • Customer • Super Admin
Availability & Scheduling • Payments & Receipts • Notifications • Permissions • Tech Stack

Document Type: Functional & System Specification

Status: Finalized

Date: August 21, 2026

Table of Contents

(In Microsoft Word: right-click the list below and choose “Update Field” to populate page numbers.)

1. Landing Page

Product: TIMEORA (by Tiemio) | Document Type: Landing Page Content & Structure Specification | Status: Finalized (Draft v1) | Date: August 19, 2026

1.1 Purpose of This Document

This document defines the finalized content, structure, and feature scope for the TIMEORA landing page. It describes what TIMEORA is, what businesses and customers will be able to do with it, and how the platform is positioned against benchmarks like SimplyBook.me. This is the reference document to be used before moving into the registration flow design.

Core Positioning Statement

TIMEORA is not a copy of SimplyBook.me. SimplyBook.me is used as a benchmark, but TIMEORA is designed with a stronger, dual-sided structure: SimplyBook.me is primarily business booking/management software, while TIMEORA is business booking/management plus an eventual customer-facing discovery marketplace.

This creates two distinct sides of the product:

Side	User Goal
Business side	"Manage my appointments."
Customer side	"Find and book an appointment."

This fits the overall system architecture:

Super Admin → Company → Staff → Services → Customers → Appointments

1.2 Header / Navigation Bar

The first element visible to any visitor.

Left Side

- Logo: TIMEORA
- Tagline: by Tiemio

Navigation Links

- Home
- Companies
- Services
- Staff / Professionals
- How It Works
- About
- Contact

Right Side

- Login
- Register
- (Optional) Language selector
- (Optional) “For Business / Get Started” button

1.3 Hero Section

The strongest, most prominent section of the page.

Main Heading (choose one)

- “Your Business. Your Services. Your Schedule.”
- “One Platform. Every Appointment.”

Subheading

Everything you need to manage appointments, staff, services, customers and bookings — all in one place.

Calls to Action

- Primary: [Get Started Free]
- Secondary: [See How It Works]

Supporting Line Below CTAs

No complicated setup. Start managing your appointments online.

1.4 Hero Booking Preview

Rather than a large customer search bar at the top, the hero section shows a visual preview of the booking experience — communicating directly to business owners: “This is what my customers will experience.”

Your Booking Page

```

TIMEORA
Choose a Service
  [ Consultation ]
Choose Professional
  [ Dr. Ahmed ]
Choose Date & Time
  [ Mon ] [ Tue ] [ Wed ]
  [ Book Now ]
  
```

1.5 Trusted By / Business Types

Section Heading: “Built for Every Service Business”

Category	Examples
Healthcare	Doctors · Clinics · Dentists
Beauty & Wellness	Salons · Spas · Stylists
Fitness	Gyms · Trainers · Yoga

Category	Examples
Education	Tutors · Academies · Coaching
Professional Services	Consultants · Lawyers · Agencies
Home & Local Services	Repair · Cleaning · Maintenance

1.6 Core Features

Section Heading: “Everything You Need to Run Your Appointments”

Features are placed earlier on the page rather than deep-buried, since they're core to conversion.

Feature	Description
Online Booking	Let customers book appointments 24/7.
Staff Management	Manage staff members, schedules and availability.
Services	Create services, prices, duration and availability.
Multiple Locations	Manage multiple branches and assign staff/services to each location.
Automated Reminders	Send appointment confirmations and reminders.
Payments	Accept payments via invoice or cash at appointment.
Reports & Analytics	Track bookings, customers, services and business performance.
Reviews	Collect customer feedback and display reviews.

1.7 Online Booking Website

Section Heading: “Give Your Business Its Own Booking Page”

Every company using TIMEORA gets a public booking page, e.g. timeora.com/company/city-care

City Care Clinic
Healthcare | Lahore

Our Services

General Consultation
30 min | Rs. 1,500
[Book Now]

Dental Consultation
45 min | Rs. 2,000
[Book Now]

1.7.1 Booking Flow Design Decision

Decision: Support both booking entry points.

Option A — Customer starts with Service (used when the customer doesn't have a preferred professional):

```

City Care Clinic
↓
Choose Service → General Consultation
↓
Choose Professional → Dr. Ahmed
↓
Choose Date
↓
Choose Available Time
↓
Book

```

Option B — Customer starts with a Professional (used when the customer wants a specific staff member).

1.7.2 Company Booking Page — Full Layout

```

CITY CARE CLINIC | Healthcare | Lahore
[ About ] [ Services ] [ Doctors ] [ Reviews ]

BOOK APPOINTMENT
What would you like to book? [ Choose a Service ▼ ]
OR
Who would you like to see?   [ Choose a Professional ▼ ]

SERVICES
General Consultation - 30 min | Rs. 1,500 - 3 doctors available [ Book ]
Dental Consultation - 45 min | Rs. 2,000 - 2 doctors available [ Book ]

OUR DOCTORS
Dr. Ahmed - General Physician - ★ 4.8 [ View Profile ] [ Book ]
Dr. Sara - Dentist - ★ 4.9             [ View Profile ] [ Book ]

```

1.7.3 Example: City Care Clinic

City Care Clinic uses TIMEORA and receives a booking page at timeora.com/company/city-care. The clinic may also maintain:

- Its own website
- Google Business profile
- Instagram
- Facebook
- WhatsApp
- (Eventually) a TIMEORA customer app

Customers can start booking from any of these entry points.

1.8 Book Anywhere (Multi-Channel Booking Architecture)

Section Heading: “Let Customers Book From Anywhere”

This is modeled on SimplyBook.me's support for multiple booking channels (booking website, business websites, Google, Facebook, Instagram) — all funneling into one calendar.

Channels:

```

TIMEORA Booking Page
↓
Business Website
↓

```

```

Social Media
↓
Google
↓
TIMEORA Customer App

```

All bookings, regardless of channel, feed into the same company calendar.

1.8.1 Architecture Diagram

1.8.2 What “Book Anywhere” Actually Means

This does not mean TIMEORA builds separate booking systems per platform. It means:

TIMEORA provides one booking engine that can be accessed from multiple channels.

This is the core architectural principle behind the feature.

1.9 Smart Scheduling

Section Heading: “Never Double-Book Again”

The system calculates real-time available slots based on:

- Real-time availability
- Staff availability
- Service duration
- Breaks
- Buffer time
- Holidays
- Multiple resources
- Multiple locations

Example: A 60-minute consultation at 4:00 PM means the assigned staff member cannot receive another conflicting booking at 4:30 PM.

Benchmark reference: SimplyBook.me supports buffer times and prevents conflicting bookings based on required providers/resources.

1.10 Customer Management

Section Heading: “Know Your Customers”

Businesses can view, per customer:

- Profile
- Contact information
- Appointment history
- Upcoming appointments
- Cancellations
- No-shows
- Reviews
- Notes
- Booking information

This elevates TIMEORA from a simple Appointment Calendar into a full Appointment + Customer Management System.

1.11 Notifications & Reminders

Section Heading: “Keep Everyone Updated”

Customer Receives	Business Receives
Booking confirmation	New booking
Appointment reminder	Cancellation
Rescheduling notification	Rescheduling
Cancellation notification	Customer updates

Channels (eventual roadmap): Email · SMS · WhatsApp · Push

Benchmark reference: SimplyBook.me currently supports automated notifications through WhatsApp, SMS, and email.

1.12 Payments

Section Heading: “Flexible Payment Options”

TIMEORA allows businesses to choose how customers pay for appointments. V1 supports two methods: Invoice and Cash Payment.

1.12.1 Method 1 — Invoice

Each invoice contains:

- Invoice number
- Customer name
- Company name
- Service

- Professional/staff member
- Appointment date
- Appointment time
- Service price
- Any applicable charges
- Total amount
- Payment status
- Invoice date

TIMEORA — INVOICE
Invoice #: INV-000123 Date: 19 Aug 2026 Customer: Maryam Company: City Care Clinic Service: Consultation Doctor: Dr. Ahmed Date: 21 Aug 2026 Time: 04:00 PM Service Price: Rs. 1,500 TOTAL: Rs. 1,500 Payment Status: Pending

The customer can view the invoice from their appointment details; the company can view and manage invoices from its dashboard.

1.12.2 Method 2 — Cash Payment / Pay at Appointment

Customer selects “Pay at Appointment” instead of paying online.

Choose Service → Choose Professional → Choose Date & Time → Customer Details

↓

Payment Method

☐ Pay at Appointment ☐ Invoice

↓

Confirm Booking → Appointment Created → Payment Pending

When the customer pays in person, staff/company updates the payment status from Pending → Paid.

1.12.3 Payment Status (V1 — Kept Simple)

Method	Statuses
Invoice	Pending · Paid · Cancelled
Cash Payment	Pending · Paid

1.12.4 Out of Scope for V1

To keep the first version focused, the following are explicitly excluded from V1 and may be added later as the product grows:

- Online payment gateway
- Deposits
- Refund system

- Cancellation charges
- Coupons
- Gift cards
- Packages
- Products
- Service add-ons

1.13 Reviews & Customer Feedback

Section Heading: “Build Trust With Reviews”

Post-appointment prompt: “How was your experience?” with a 5-star rating and a “Write a Review” action. Businesses can then display average rating, reviews, and customer feedback.

1.14 Business Analytics

Section Heading: “Understand Your Business”

Promoted on the landing page as a preview of the company dashboard.

Metric	Example Value
Appointments	1,248
Revenue	Rs. 450K
New Customers	182
Completed	1,080
Cancelled	68
No Shows	32

Charts:

- Bookings over time
- Most booked services
- Most booked staff
- Revenue
- Customer growth
- Cancellation rate

1.15 Multiple Locations

Section Heading: “One Business. Multiple Locations.”

Glow Beauty – Lahore

- Gulberg Branch
- DHA Branch
- Johar Town Branch

Each location can independently have its own:

- Staff
- Services
- Working hours
- Availability
- Address

1.16 Customer Experience (Booking Journey)

Section Heading: “Simple For Your Customers”

Discover → Choose Service → Choose Professional → Choose Date → Choose Time

↓

Enter Details → Pay / Confirm → Appointment Confirmed

1.17 Why TIMEORA?

Section Heading: “Why Businesses Choose TIMEORA” (business-focused, not generic)

Benefit	Description
Save Time	Reduce manual appointment management.
Reduce No-Shows	Automated reminders and notifications.
Stay Organized	Manage staff, services and schedules from one dashboard.
Grow Your Business	Reviews, promotions and customer insights.
Be Available 24/7	Customers can book even when your business is closed.
One Platform	Bookings + customers + staff + payments + analytics.

1.18 Final Call to Action

Section Heading: “Ready to Take Your Business Online?”

| *Start accepting appointments without the hassle of managing everything manually.*

- [Start Free]
- [Explore Features]

Supporting Line:

| *No complicated setup. No long learning curve.*

TIMEORA by Tiemio — “One Platform. Every Appointment.”

1.20 Strategic Positioning Note

This is an important distinction for the project going forward:

- Do not copy SimplyBook.me exactly. It is used purely as a functional benchmark.
- TIMEORA's structure is intentionally stronger and dual-sided: SimplyBook.me → primarily business booking/management software; TIMEORA → business booking/management + an eventual discovery marketplace, where customers can discover companies through TIMEORA itself, not just book directly.
- This supports the two-sided product model: Business side “Manage my appointments” and Customer side “Find and book an appointment.”
- This aligns with the overall system architecture: Super Admin → Company → Staff → Services → Customers → Appointments.

Next step: With this landing page structure finalized (and no AI features in this version), the next design phase is the registration flow.

2. Register

Architecture: one common Register page with two role-selection buttons. The user chooses their role, and the system routes them into the appropriate registration flow/portal.

2.1 Register Page

The page will show:

Create Your Account

Choose how you want to use TIMEORA

- [Register as Company] — Manage your business, staff, services, schedules and appointments.
- [Register as Customer] — Find a company and manage your appointments.

2.2 Register as Company

If the user clicks Register as Company, they enter the finalized Company Registration flow:

Only company registration information is collected here.

2.3 Register as Customer

If the user clicks Register as Customer, they are taken to the Customer side/portal. Because the architecture is company-specific, the company context must be preserved where relevant.

↓
 Select / Enter Company
 ↓
 Customer Registration
 ↓
 Customer Account

Or, if the customer arrived from a specific company's booking portal:

Shifa Clinic Booking Portal
 ↓
 Register
 ↓
 Customer Registration
 ↓
 Customer Account

That customer then automatically belongs to Shifa Clinic.

2.4 Role Separation

Company

TIMEORA → Register → Register as Company → Company Account → Company Portal

Customer

Company Booking Portal → Register → Register as Customer → Customer Account → Customer Portal

The portal is determined by the role.

2.5 Final Register Page Layout

One page → two role buttons → each role follows its own registration/portal flow.

Final architecture:

TIMEORA Landing Page → Register → Choose Role
 → Company → Company Registration → Company Portal
 OR
 → Customer → Customer Portal → Customer Registration → Customer Portal

Staff and Super Admin do not appear as registration options, because their accounts are created/managed through their own authorized flows.

2.6 Final Registration Feature Summary

Feature	Included
---------	----------

Feature	Included
Company registration	Yes
Email field	Yes
Password field	Yes
Confirm password field	Yes
Email validation	Yes
Duplicate email check	Yes
6-digit OTP	Yes
OTP delivered via email	Yes
OTP expiration	Yes
Resend OTP	Yes
Wrong OTP handling	Yes
OTP rate limiting	Yes
Email verification	Yes
Registration success confirmation	Yes
Company profile setup	No — handled in a later stage
Customer registration	No — not part of this flow
Staff registration	No — not part of this flow
AI features	No

2.7 Summary

The finalized first stage of the TIMEORA platform is:

Register → Validate → Send OTP → Verify OTP → Registration Complete

Once this sequence is complete, registration is finished. Profile setup and all subsequent configuration steps are treated as a separate, later stage.

3. Login — Company Admin Authentication

The Company Login is used by the Company Admin who manages one company on TIMEORA. This flow includes JWT-based authentication and is kept fully separate from Company Profile, Company Settings, Staff Management, Customer Management, Company Onboarding, Staff Login, Customer Login, and Super Admin functionality.

Key architectural decisions:

- Use Company Admin rather than a generic “Company” role for the authenticated identity.
- Add an explicit role check.
- Add a company ownership/scope check for protected resources.
- Keep Company Login separate from onboarding/profile setup.
- Email verification happens during registration; login only checks its status.
- JWT + refresh-token architecture is the recommended production design.
- Keep OTP for password reset, not necessarily for every login.
- Add account/company status checks.
- Keep Super Admin, Staff, and Customer authentication completely separate.

3.1 Company Admin Clicks “Login”

From the TIMEORA landing page: [Login] [Register]. Register creates a new company account; Login is for an existing Company Admin.

Login Page

```
Welcome Back
Email Address [ _____ ]
Password      [ _____ ]
[ Login ]
Forgot Password?
Don't have a company account? Register
```

3.2 Enter Email & Password

Company Admin enters Email Address and Password, then clicks [Login]. The frontend sends the authentication request to the backend, e.g. POST /api/auth/company/login, containing email and password.

3.3 Backend Validates Credentials

3.3.1 Check Email

The system searches for the account associated with the submitted email. If the credentials are invalid, it returns a generic message: “Invalid email or password.” The system should not reveal whether the email exists, does not exist, or whether the password was incorrect — this prevents account enumeration.

3.3.2 Check Password

The submitted password is compared against the securely hashed password stored in the database. If incorrect: “Invalid email or password.” Passwords must never be stored in plain text.

3.4 Check Account Role

After credentials are validated, the backend verifies that the authenticated account is actually a Company Admin.

Credentials Valid → Check Role → Role = Company Admin?

Only COMPANY_ADMIN can continue through the Company Login flow. Other roles — Super Admin, Staff, Customer — must not be authenticated through the Company Admin login endpoint. If the role is not permitted: “You are not authorized to access the Company Admin area.”

3.5 Check Email Verification

Company Registration requires email verification, so Company Login must verify that the company's email has already been verified.

Email → Password → Role = Company Admin → Email Verified?

If not verified: “Please verify your email before logging in.” and provide [Resend OTP].

Email verification is primarily part of Company Registration. Login does not perform registration again — it simply checks email_verified = true.

3.6 Check Company / Account Status

After credentials, role, and email verification checks pass, the system checks the account and company status.

- Active — allow login.
- Pending — do not allow normal Company Admin access until the required registration/verification process is completed.
- Suspended — block access.
- Deactivated — block access.

For unavailable accounts: “Your account is currently unavailable. Please contact support.” The exact message can be adjusted to avoid revealing unnecessary internal account information.

3.7 Generate JWT Authentication

If all checks pass — email correct, password correct, role valid, email verified, account active, company active — the backend authenticates the Company Admin and creates JWT-based authentication.

Email → Password → Credentials Valid → Role = Company Admin → Email Verified → Account Active → Company Active → LOGIN SUCCESS → Generate JWT Authentication

3.8 JWT Payload

The JWT should contain only the information required for authentication/authorization. Example:

```
{
  "sub": "123",
  "role": "COMPANY_ADMIN",
  "companyId": "45",
  "iat": "...",
  "exp": "..."}
}
```

Recommended information: User ID / subject, Role, Company ID, Issued-at time, Expiration time.

Must NOT contain: Password, Password hash, OTP, Payment credentials, Sensitive personal information, other unnecessary confidential data.

3.9 Secure JWT Storage

For the production architecture, the preferred approach is HttpOnly + Secure cookies rather than storing authentication tokens directly in localStorage or sessionStorage. This reduces exposure of tokens to client-side JavaScript.

Company Admin Login → Backend Authentication → Access JWT + Refresh Token → Secure HttpOnly Cookies → Authenticated Company Admin

3.10 JWT on Protected Company Requests

After login, Company Admin can access protected Company Admin APIs, e.g. GET /api/company/dashboard.

Company Admin → Protected API Request → Authentication Cookie / JWT → Authentication Middleware → Verify JWT → Extract User ID → Extract Role → Extract Company ID → Authorization → Allow Request

3.11 Company Data Isolation

JWT authentication alone is not enough. After verifying the JWT, the backend must ensure that the requested resource belongs to the authenticated Company Admin's company. Example: Company Admin with companyId = 45 tries to access a Service with companyId = 72 — the backend must reject the request.

JWT Valid → Role Valid → Company ID Check → Resource belongs to Company?
 └─ Yes → Allow
 └─ No → 403 Forbidden

A Company Admin can access only resources belonging to their own company.

This applies to Services, Staff, Customers, Appointments, Availability, Reports, Analytics, Notifications, and other company resources.

3.12 Protected API Example

GET /api/company/dashboard
 ↓
 Authentication Middleware → Verify JWT
 ↓
 Role Middleware → Check COMPANY_ADMIN
 ↓
 Company Scope / Authorization
 ↓
 Load authenticated company data → Return response

If JWT is missing or invalid: 401 Unauthorized. If JWT is valid but the user doesn't have permission: 403 Forbidden.

3.13 JWT Expiration

JWTs should have an expiration time (User ID, Role, Company ID, Issued At, Expiration). When the access token expires, the request is rejected and a Refresh Token is used to obtain a new access JWT.

Access Token: short-lived JWT. Refresh Token: longer-lived token used to obtain a new access token. Exact durations are finalized during the technical implementation/security phase.

3.14 Refresh Token

Login → Access JWT + Refresh Token → Secure HttpOnly Cookies

When access JWT expires:

API Request → Access JWT Expired → Refresh Token → Backend Validates Refresh Token → New Access JWT → Continue Request

Refresh tokens should support: Expiration, Revocation, Rotation, and Device/session tracking where required.

3.15 Forgot Password

Forgot Password → Enter Email → [Send OTP] → Password Reset OTP Sent → Enter OTP → Verify OTP → Create New Password → Confirm New Password → Password Updated → Return to Login

The Company Admin should not automatically be logged in after resetting the password.

3.15.1 Enter Email

Forgot Password?

Email Address [_____]

[Send OTP]

If an account exists for this email, a verification code has been sent.

This prevents account enumeration.

3.15.2 Password Reset OTP

The Company Admin receives a 6-digit OTP, e.g. "Your TIMEORA password reset code is 729184."

Enter Verification Code

[_ _ _ _ _]

[Verify]

Didn't receive the code? [Resend OTP]

OTP Security: 6-digit OTP, short expiration, maximum verification attempts, resend rate limiting, new OTP invalidates previous OTP, and OTP should be securely handled and not stored as plain text where avoidable.

3.15.3 Create New Password

Create New Password

New Password [_____]

Confirm Password [_____]

[Reset Password]

Password must follow the TIMEORA password policy. After successful reset: "Password has been reset successfully." Then return the Company Admin to the Login page.

3.16 Password Requirements

Company Admin passwords should have strong requirements. Recommended:

- Minimum 8 characters
- Uppercase letter

- Lowercase letter
- Number
- Special character

The same password policy should be used during Company Registration, Password Reset, and Password Change.

3.17 Logout

Company Admin → Logout → Invalidate / Revoke Authentication → Clear Secure Authentication Cookies → Login Page

With the recommended JWT architecture, logout should handle the refresh-token/session side as well:

- Revoke refresh token/session
- Clear authentication cookies
- Prevent further token refresh
- Redirect to Login

3.18 Login Security

Authentication

- Email + Password
- Secure password hashing
- JWT authentication
- Access-token expiration
- Refresh-token strategy
- Protected API routes
- Role verification

Account Protection

- Email verification
- Account status checking
- Company status checking
- Login rate limiting
- Temporary lock/throttling after repeated failures
- Secure password reset

Session Security

- HttpOnly cookies
- Secure cookies
- Refresh-token rotation/revocation
- Logout
- Session management
- Logout from all devices — later in Account/Security Settings

Audit

Log important authentication events:

- Successful login
- Failed login
- Logout
- Password reset request
- Password reset completion
- Suspicious login attempts
- Account lock/throttle events

3.19 Optional 2FA

2FA should not be required for the initial TIMEORA MVP. However, the authentication architecture should allow it to be added later. Possible future options: Authenticator app, Email OTP, Backup codes.

For the initial version, keep Email verification + strong password + JWT + refresh token + rate limiting + secure cookies as the core authentication system.

3.20 Final Company Login Flow

3.21 Final TIMEORA Company Authentication Module

Company Registration

Register → Company Information → Admin Email + Password → OTP Verification → Company Account Created/Activated

Company Login

Email + Password → Validate Credentials → Check Company Admin Role → Check Email Verification → Check Account/Company Status → Generate JWT → Secure Token Storage → Company Admin Area

Password Reset

Forgot Password → Email → OTP → Verify → New Password → Password Updated → Login

Logout

Logout → Revoke/Invalidate Refresh Session → Clear Secure Cookies → Login Page

Protected Company APIs

Request → Verify JWT → Check Company Admin Role → Check company_id ownership → Allow/Deny

4. Company Admin

The Company Admin is the owner/manager of ONE company on TIMEORA. This section defines the Company Admin's dashboard, company management pages, services, staff, customers, appointments, availability, communication and reports.

4.1 Company Dashboard

The first page after Company Admin login.

Purpose

Give the admin an overall view of their company's current operations.

Should Show

- Today's appointments
- Upcoming appointments
- Completed appointments
- Cancelled appointments
- Total customers
- Total staff/professionals
- Total active services
- Today's revenue (if payments are included)
- Appointment status overview
- Upcoming appointments list
- Staff availability summary
- Recent activity

Quick Actions

- Add Staff
- Add Service
- Create Appointment
- View Calendar

Important: the dashboard should show only this company's data.

4.2 Company Profile

This is where the Company Admin manages the public/business information of their company.

Information

- Company name
- Company logo
- Business description

- Business category
- Contact email
- Phone number
- Website
- Address
- City
- Country
- Business location/map
- Social media links

Admin Actions

- Edit company information
- Upload/change logo
- Update contact information
- Update business address

Important: the Company Admin cannot change platform-level information such as their company ID, subscription/system configuration controlled by Super Admin, or system-wide settings.

4.3 Company Admin Architecture

```
Company Admin
├── Dashboard
├── Company — Profile / Settings
├── Services — List / Add / Details / Edit
├── Staff — List / Add-Invite / Details / Edit / Schedule
├── Customers — List / Details / Add-Invite
├── Appointments — List / Details / Create / Reschedule / Calendar
├── Availability — Business Hours / Staff Availability / Blocked Time
├── Communication — Notifications / Messages (Optional)
├── Reports — Appointment / Customer / Staff Performance / Business Analytics
```

4.4 Company Settings

Settings specific to that company.

Account Settings

- Company email
- Password change
- Login/security settings

Booking Settings

- Allow online bookings
- Booking confirmation settings
- Cancellation rules
- Rescheduling rules
- Minimum booking notice

- Maximum advance booking period

Notification Settings

- Email notifications
- Appointment reminders
- Cancellation notifications
- Staff notifications
- Customer notifications

Business Preferences

- Time zone
- Currency
- Date format
- Time format

4.5 Services

4.5.1 Services List

Shows all services offered by the company. Each service can show: service name, category, duration, price, assigned staff, status, and number of bookings.

Actions: View, Edit, Delete/deactivate, Add service.

4.5.2 Add Service

Company Admin creates a service offered by the company.

Fields: Service name, Description, Category, Duration, Price, Service image (optional), Assigned staff/professionals, Booking availability, Status.

Example: a clinic could create Service: General Consultation, Duration: 30 minutes, Price: Rs. 2,000.

4.5.3 Edit Service

Same information as Add Service, but used to modify an existing service. Admin can change name, description, duration, price, assigned staff, and activate/deactivate the service.

4.5.4 Service Details

Read-only/detailed view of a service, showing: service information, duration, price, assigned professionals, total bookings, upcoming appointments, service status, created date, and last updated date.

4.6 Staff / Professionals

4.6.1 Staff List

Shows all professionals working under the company: name, profile image, role/profession, email, phone, assigned services, availability status, account status.

Actions: View, Edit, Manage schedule, Deactivate.

4.6.2 Add Staff / Professional

Company Admin can create/invite staff accounts.

Fields: Full name, Email, Phone, Profile picture, Professional title, Bio, Assigned services, Working days, Working hours.

Account flow: Company Admin enters staff information → system sends invitation → staff sets password → staff gets access to their Staff account.

The Company Admin should not manage the staff member's personal login after creation, except account activation/deactivation/reset-related administrative actions allowed by the system.

4.6.3 Staff Details

Detailed profile of one staff member: personal/professional profile, contact information, assigned services, schedule, upcoming/completed appointments, cancellation statistics, performance statistics, account status.

4.6.4 Edit Staff / Professional

Company Admin can update: name, phone, professional title, bio, profile image, assigned services, status. They can also activate/deactivate the staff account.

4.6.5 Staff Schedule

Admin manages the schedule of a particular professional. Admin can configure: working days, start time, end time, break time, service-specific availability, days off, leave, blocked slots.

Example: Dr. Ahmed — Monday-Friday, 9:00 AM – 5:00 PM, Break: 1:00 PM – 2:00 PM.

This schedule becomes part of the appointment availability calculation.

4.7 Customers

4.7.1 Customer List

Shows customers who have interacted/booked with the company: customer name, email, phone, total appointments, upcoming appointment, last appointment, status.

Actions: View, Create appointment, View appointment history.

4.7.2 Customer Details

Company-level customer profile: customer basic information, contact information, appointment history with this company, upcoming/completed/cancelled appointments, total bookings, last visit.

The Company Admin sees the customer's relationship with their company, not the customer's entire TIMEORA history.

4.7.3 Add / Invite Customer

Company Admin can manually add a customer or invite them.

Add Customer: Name, Email, Phone.

Invite Customer: Email/phone; system sends invitation; customer can create/access their account.

This is useful for companies that already have existing customers outside TIMEORA.

4.8 Appointments

4.8.1 Appointments

Central appointment management page.

Filters: Today, Upcoming, Completed, Cancelled, Pending, Staff, Service, Customer, Date.

Appointment information: Customer, Service, Staff, Date, Time, Status.

Admin actions: View, Create, Reschedule, Cancel, Mark completed, Update status.

4.8.2 Appointment Details

Detailed information about one appointment: Appointment ID, Customer, Service, Staff member, Date, Time, Duration, Status, Booking source, Customer notes, Appointment notes, Created date, Updated date. If payments are included: Payment status, Amount, Payment method.

4.8.3 Create Appointment

Company Admin can manually create an appointment on behalf of a customer.

Select Customer → Select Service → Select Staff → Select Date → Show available slots → Select Time → Confirm

This is important because customers may call or visit the company directly.

4.8.4 Edit / Reschedule Appointment

Admin can change date, time, staff, service, and appointment notes. The system should automatically check availability before allowing the change, and customer/staff notifications should be triggered when appropriate.

4.8.5 Calendar

Company-wide appointment calendar.

Views: Day, Week, Month.

Filters: Staff, Service, Appointment status.

Calendar should show: Appointment time, Customer, Staff, Service, Status. Admin can click an appointment to open its details.

4.9 Availability

4.9.1 Business Working Hours

This defines when the company itself operates.

Day	Hours
Monday	9 AM – 6 PM
Tuesday	9 AM – 6 PM

Day	Hours
Wednesday	9 AM – 6 PM
Thursday	9 AM – 6 PM
Friday	9 AM – 6 PM
Saturday	10 AM – 3 PM
Sunday	Closed

This is the company-level availability.

4.9.2 Staff Availability

This defines when individual professionals are available.

Example: Company 9 AM – 6 PM; Dr. Ahmed 10 AM – 4 PM; Dr. Sara 9 AM – 2 PM.

The actual bookable slots should respect both company hours and staff availability.

4.9.3 Blocked Time / Holidays

Company Admin can block time when appointments should not be available.

Examples: Public holidays, Company holidays, Maintenance, Staff meetings, Special closure, Emergency closure, Individual staff leave.

Types: Company-wide block (e.g. Company closed on 14 August), Staff-specific block (e.g. Dr. Ahmed unavailable on 20 August).

4.10 Communication

4.10.1 Notifications

Company Admin receives operational notifications: New appointment, Appointment cancellation, Appointment rescheduled, New customer, Staff invitation accepted, Staff account changes, Upcoming appointment reminders, System alerts. Admin can mark notifications as Read or Unread.

4.10.2 Messages (Optional for V1)

If included, Company Admin can communicate with Customers and Staff.

Customer communication example: “Your appointment has been confirmed for 3:00 PM.”

Staff communication example: “Please confirm your availability for tomorrow.”

Keep this as an internal TIMEORA communication system rather than a full social/chat platform.

4.11 Reports

4.11.1 Appointment Reports

Company-level appointment analytics.

Metrics: Total appointments, Completed, Cancelled, Pending, No-show, Rescheduled, Appointments by day/week/month, Appointments by service, Appointments by staff.

Filters: Date range, Staff, Service, Status.

4.11.2 Customer Reports

Metrics: Total customers, New customers, Returning customers, Active customers, Customers with most appointments, Customer booking frequency, Customer cancellation rate.

4.11.3 Staff Performance

Metrics: Total appointments, Completed appointments, Cancelled appointments, No-shows, Total working hours, Utilization, Appointments per staff, Service bookings, Customer ratings (if reviews are included).

This should be company management analytics, not a replacement for the Staff dashboard.

4.11.4 Business Analytics

The overall company-level analytics page.

Main KPIs: Total bookings, Revenue (if payments are implemented), New customers, Returning customers, Appointment completion rate, Cancellation rate, No-show rate, Staff utilization, Most popular services, Peak booking times.

Charts: Booking trends, Revenue trends, Customer growth, Service popularity, Staff performance, Appointment status distribution.

Filters: Today, This week, This month, This year, Custom date range.

4.12 Final Company Admin Sidebar

Dashboard
 Company — Company Profile / Company Settings
 Services — Services
 Staff — Staff / Staff Schedule
 Customers — Customers
 Appointments — Appointments / Calendar
 Availability — Business Hours / Staff Availability / Blocked Time
 Communication — Notifications / Messages (optional)
 Reports — Appointment / Customer / Staff Performance / Business Analytics

4.13 Most Important Architectural Rule

Role	Responsibility
Super Admin	Manages the TIMEORA platform and companies
Company Admin	Manages their company, services, staff, customers, appointments, availability and business analytics
Staff / Professional	Manages their own profile, schedule and assigned appointments
Customer	Searches, books and manages their own appointments

The Company Admin should not have Super Admin capabilities, and should not have unrestricted access to other companies' data. This separation keeps the Laravel authorization/middleware structure clean.

4.14 Company Admin Data Architecture

Every company-owned resource should be connected to a company. Conceptually:

```

Company
├── Company Admin
├── Services
├── Staff
├── Customers
├── Appointments
├── Business Hours
├── Blocked Times
└── Reports
  
```

For example, tables such as `companies(id)`, `services(id, company_id)`, `staff(id, company_id)`, `customers(id, company_id)`, and `appointments(id, company_id, customer_id, staff_id, service_id)` make company isolation much easier to enforce.

4.15 Final Company Admin Flow

```

Company Registration → Email Verification → Company Account Created → Company Admin Login → Company
Dashboard
↓
Configure Company → Add Services → Add/Invite Staff → Configure Staff Schedules → Configure Business
Hours → Configure Blocked Time
↓
Company Ready for Booking → Customers Book Appointments → Company Admin Manages Appointments +
Customers + Staff → Reports & Analytics
  
```

5. Staff / Professional

The Staff/Professional module is finalized separately from Super Admin and Company, with structural boundaries so Staff do not get access to anything that belongs to the Company Admin.

5.1 Staff Login

- Staff logs in using credentials provided/invited by the Company.
- Email + password
- Email verification if required
- Forgot/reset password
- JWT authentication
- Role verification: STAFF

Staff cannot register themselves from the public landing page.

5.2 Staff Dashboard

Main overview of the staff member's work:

- Today's appointments
- Upcoming appointments
- Completed appointments
- Cancelled appointments
- Today's schedule
- Availability status
- Quick actions
- Notifications

5.3 My Appointments

Staff sees only appointments assigned to them.

- Upcoming
- Today
- Completed
- Cancelled
- Appointment status
- Customer name
- Service
- Date/time

5.4 Appointment Details

Detailed view of one appointment: customer information, service, date & time, appointment status, notes, booking information.

Actions allowed to staff: Confirm, Start, Complete, Cancel/decline — only if Company policy allows it.

5.5 My Calendar

Calendar-based view of the staff member's appointments.

- Day
- Week
- Month
- Appointment slots
- Blocked/unavailable periods

5.6 My Availability

Staff manages when they are available to receive appointments.

Example: Monday → 9 AM–5 PM, Tuesday → 9 AM–5 PM, Wednesday → Unavailable.

Also: breaks, temporary unavailable periods, holidays/leave, block specific dates.

5.7 My Schedule

This is different from Calendar. Calendar = appointment visualization. Schedule = working hours/working pattern.

Staff can view: working days, working hours, breaks, assigned shifts, day-off information.

If the Company controls staff schedules centrally, this page should be view-only for staff.

5.8 Customer Details

Staff can view customers associated with their appointments: customer name, contact information, appointment history with that staff member, relevant booking notes.

Staff should not have access to the entire company's customer database unless the Company explicitly permits it.

5.9 Appointment History

Historical appointments handled by that staff member: Completed, Cancelled, No-show, Date, Customer, Service, Appointment details.

5.10 Notifications

Staff receives: New appointment notifications, Appointment changes, Cancellation notifications, Reminders, Schedule changes, Company announcements.

5.11 My Profile

Staff manages their own professional profile: name, profile picture, phone, email, professional title, bio, services assigned to them (preferably controlled by Company), password change.

Important: Staff should not be able to change Company ownership, company information, role, or permissions.

5.12 Settings

Staff-specific settings: notification preferences, password/security, time zone, language, account preferences, logout.

5.13 Staff Permissions

Staff CAN

- View their appointments
- View assigned customers
- Manage their availability if Company allows it
- View their schedule
- Update appointment status
- View appointment history
- Manage their own profile
- Receive notifications

Staff CANNOT

- Create a company
- Register a company
- Manage company settings
- Add/remove staff
- Manage other staff
- Access Super Admin
- Manage billing/subscription
- See all company customers by default
- Change their own role
- Delete the company

5.14 Recommended Hierarchy

```

Super Admin
↓
Company Admin
↓
Staff / Professional
↓
Customer
  
```

This keeps the system clean: Super Admin controls the platform → Company controls its business → Staff handles assigned work → Customer books services.

“My Calendar” and “My Schedule” are kept as separate pages, but their purposes stay clearly different — Calendar visualizes appointments while Schedule defines the working pattern, preventing confusion in the Company panel.

6. Customer Module

6.1 Customer Architecture

TIMEORA customers are global platform users. A customer is not permanently associated with a single company and can book appointments with different companies and professionals.

The customer lifecycle is:

```
Customer Registration → Common Login → Role Identification = Customer → Customer Dashboard
↓
Professional Discovery → Professional / Company Profile → Select Service → Select Date & Time
↓
Booking Request → Staff Accept / Reject → Confirmed / Rejected
↓
Appointment Management → Payment at Reception → Receipt Generation
```

6.2 Customer Registration

Customers can publicly create their own TIMEORA accounts.

Registration fields: Full Name, Email Address, Phone Number, Password, Confirm Password.

```
Landing Page → Register → Select Customer → Customer Registration Form → Account Created → Customer Dashboard
```

Customers are not required to select or connect to a company during registration.

6.3 Customer Login

Customers and Company users use the same login interface.

```
Common Login → Credential Authentication → Role Identification → Customer → Customer Dashboard
```

The backend determines the authenticated user's role and redirects the user to the appropriate portal.

6.4 Customer Dashboard

The Customer Dashboard is primarily a professional discovery and appointment management interface.

Dashboard components: Global search, Professional/employee categories, Featured professionals, Available professionals, Upcoming appointment, Notifications, Quick access to My Appointments.

Professional categories are dynamically based on the platform's registered companies, professionals, and services, e.g.:

```
Healthcare — Doctors / Dentists / Physiotherapists
Beauty — Hair Stylists / Beauticians / Makeup Artists
Fitness — Trainers / Coaches / Instructors
```

6.5 Professional Card

Each professional displayed to a customer is represented by a professional card.

Card information: Profile image, Professional name, Designation, Profession/category, Company name, Rating (if enabled), Availability indicator, View Profile, Company Details.

Ahmed Khan
 Senior Barber
 ABC Salon
 ★ 4.8
 Available
[\[View Profile\]](#) [\[Company Details\]](#)

6.6 Company Profile

Selecting “Company Details” from a professional card opens the company profile.

Company profile information: company logo, company name, about company, location, contact information, working hours, services, professionals, company availability.

The customer can therefore discover a professional while still being able to inspect the company to which that professional belongs.

6.7 Professional Profile

Selecting “View Profile” opens the professional's detailed profile.

Professional information: profile image, name, designation, profession, experience, bio, specialization, services provided, working hours, availability, rating/reviews (if implemented).

The profile contains a Book Appointment action.

6.8 Service Selection

Services displayed to the customer are based on the selected professional's eligible services.

Company → Professional → Eligible Services

The customer should only be able to select services that the selected professional is authorized to provide. For V1, every appointment occupies exactly one hour.

6.9 Appointment Booking

The customer can initiate booking from a Professional Card, Professional Profile, or Company Profile where applicable.

The system automatically identifies Customer, Company, Professional, and Service — the customer does not need to manually select the company after selecting a professional.

6.10 Date Selection

The customer selects a date after selecting the service and professional. The calendar considers:

- Company working schedule
- Professional working schedule
- Company holidays
- Professional days off
- Schedule exceptions
- Blocked periods

- Existing appointments

Only dates containing valid availability should be presented as bookable.

6.11 Time Selection

TIMEORA uses a fixed one-hour appointment model, e.g. 09:00–10:00, 10:00–11:00, 11:00–12:00, 12:00–13:00.

A slot is unavailable when it is:

- Already confirmed/booked
- Temporarily reserved by a pending request
- Blocked
- During a break
- Outside professional working hours
- Affected by leave or schedule exceptions

6.12 Booking Request

A customer selecting an available slot does not immediately receive a confirmed appointment.

Select Slot → Submit Booking Request → Appointment Status = Pending → Request Sent to Staff

The customer can see the request with its Pending status.

6.13 Staff Booking Decision

The selected professional receives the booking request through the Staff Portal.

Request information: Customer, Company, Professional, Service, Date, Time, Duration, Price, Booking details.

Staff actions: Accept | Reject.

6.14 Booking Acceptance

When the professional accepts the request:

- Appointment status becomes Confirmed
- The selected one-hour slot becomes officially booked
- The appointment is added to the professional's calendar
- The appointment appears in the customer's appointments
- The same appointment becomes visible in the Company Portal
- The slot becomes unavailable to other customers
- Availability is recalculated
- Customer receives confirmation

Cross-Portal Relationship: one appointment record is associated with Customer + Company + Professional + Service, so the same appointment appears automatically in all relevant portals.

6.15 Booking Rejection

When the professional rejects the request:

- Appointment status becomes Rejected
- The requested slot becomes available again
- The appointment is not added as a confirmed calendar booking
- Customer is notified
- Customer may select another available slot

6.16 Booking Confirmation

After staff acceptance, the customer receives the confirmed appointment details:

- Booking ID
- Company
- Professional
- Service
- Date
- Time
- Duration: 1 Hour
- Price
- Payment Method: Cash on Reception
- Payment Status: Unpaid
- Appointment Status: Confirmed

6.17 Appointment Rescheduling

Rescheduling is also request-based.

Appointment Details → Reschedule → Select New Date → Select Available One-Hour Slot → Submit
Reschedule Request → Staff Review

Staff actions: Accept, Reject.

If accepted: old slot is released, new slot becomes booked, professional calendar is updated, customer appointment is updated, Company Portal is updated, availability is recalculated.

If rejected: the existing appointment remains unchanged.

6.18 Appointment Cancellation

Customers can cancel eligible upcoming appointments according to company cancellation rules.

Appointment → Cancel Appointment → Cancellation Confirmation → Status = Cancelled

After cancellation: slot becomes available, professional calendar is updated, Company Portal is updated, availability is recalculated. Company/staff-initiated cancellations follow the same central appointment update mechanism.

6.19 Appointment Lifecycle

Primary lifecycle:

Pending → Confirmed → Checked-in → In Progress → Completed

Alternative states: Pending → Rejected; Confirmed → Cancelled; Confirmed → No-show.

Final appointment statuses: Pending, Confirmed, Rejected, Checked-in, In Progress, Completed, Cancelled, No-show.

6.20 Check-in and Completion

On the appointment date, authorized staff can update the appointment status:

Confirmed → Checked-in → In Progress → Completed

Completed appointments are moved into appointment history.

6.21 No-show

If a customer does not attend a confirmed appointment, authorized staff can mark it as No-show (Confirmed → No-show). The appointment remains part of the historical record.

6.22 Customer Appointments

Customers can view appointments by status/category: Upcoming, Pending, Confirmed, Completed, Cancelled, Rejected, No-show.

6.23 Appointment Details

The Appointment Details page displays: Appointment ID, Customer, Company, Professional, Service, Date, Time, Duration, Price, Appointment status, Payment status.

Possible actions (depending on status and company policies): View Receipt, Reschedule, Cancel.

6.24 Appointment History

Historical appointments remain accessible to the customer: Completed appointments, Cancelled appointments, Rejected requests, No-show appointments. Associated payment and receipt records remain connected to their original appointment where applicable.

6.25 Customer Notifications

Customers receive appointment-related notifications: Booking request submitted, Booking accepted, Booking rejected, Appointment reminder, Appointment rescheduled, Appointment cancelled, Appointment completed, Company/system announcements.

Example: "Your appointment with Ahmed Khan is tomorrow at 4:00 PM."

6.26 Customer Profile

Customers can manage their personal information: profile picture, full name, email, phone, other permitted profile information. Customers can update their own profile.

6.27 Customer Settings

Customer settings include: change password, notification preferences, email notification preferences, SMS notification preferences, privacy settings, logout.

6.28 Cross-Portal Appointment Architecture

Every appointment should contain the core relationships:

```
Appointment
├── customer_id
├── company_id
├── professional_id
├── service_id
├── date
├── time
├── duration
├── appointment_status
├── payment_status
```

The same appointment is then visible according to role:

```
APPOINTMENT
├── CUSTOMER PORTAL → My Appointment
├── COMPANY PORTAL → Bookings
├── PROFESSIONAL PORTAL → My Appointments
```

This creates a centralized appointment architecture rather than separate appointment records for each portal.

7. Super Admin Module

7.1 Super Admin Role

The Super Admin manages TIMEORA as a platform rather than managing the daily operations of individual companies.

Super Admin Responsibilities

- Manage companies at platform level
- Monitor platform activity
- View platform users
- Monitor appointments
- Monitor receipts
- View platform analytics
- Manage global categories
- Manage system notifications
- Manage platform settings
- View audit logs
- Suspend/reactivate companies

Super Admin Does Not Manage

- Company schedules
- Professional availability
- Company services
- Daily company bookings
- Professional schedules
- Company operational customers
- Cash collection

These responsibilities belong to Company Admin and authorized company staff.

7.2 Super Admin Authentication

Super Admin access is private.

Login fields: Email, Password.

Super Admin Login → Credential Validation → Role Verification → Super Admin Dashboard

There is no public Super Admin registration. For V1, the security scope remains: Email verification, Strong password requirements. Advanced MFA/2FA is outside the current scope.

7.3 Super Admin Dashboard

The Super Admin Dashboard provides a platform-wide overview of TIMEORA.

Company Statistics

- Total Companies
- Active Companies
- Suspended Companies
- New Company Registrations

User Statistics

- Total Customers
- Total Professionals
- Active Users
- New Users

Appointment Statistics

- Total Appointments
- Today's Appointments
- Pending
- Confirmed
- Upcoming
- Completed
- Cancelled
- No-show

Receipt Statistics

- Total Receipts
- Today's Receipts
- Pending Payments
- Paid Payments

Receipt statistics represent payment/receipt activity, not TIMEORA revenue.

7.4 Dashboard Analytics

The dashboard can include:

- Company Growth — new registrations, active vs suspended companies, growth over time
- Customer Growth — new customer registrations, growth trends
- Appointment Trends — daily / weekly / monthly, status distribution
- Most Active Companies — ranked by appointment volume, customer volume, professional activity
- Popular Services/Categories — services/categories receiving the highest appointment volume
- Receipt Activity — receipt generation, paid/unpaid trends

7.5 Dashboard Alerts

Platform-level alerts may include: Suspended companies, System errors, Important platform notifications.

Outside current scope: Payment gateway failures, Pending company approval, No-show alerts as a dedicated dashboard alert, AI-generated insights.

7.6 Companies

The Companies module provides platform-level company management.

Companies List

Display: Company name, Category, Status, Professional count, Customer count, Appointment count, Registration date.

Company statuses: Active, Suspended.

There is no Pending/Approved/Rejected company state because company registration is activated through the finalized verification flow.

7.7 Company Details

Super Admin can inspect:

Company Information

- Company name
- Logo
- Category
- Description
- Email
- Phone
- Address
- Website
- Registration date
- Account status

Company Admin

- Admin name
- Admin email
- Account status
- Account creation date
- Last login

Company Customers / Professionals / Services / Appointments / Receipts / Analytics / Activity

- Company Customers — customer count, active customers, customer list
- Company Professionals — professional count, active professionals, professional list
- Company Services — Super Admin can view company services but does not manage operational service configuration

- Company Appointments — view, search, filter, inspect appointment details
- Company Receipts — Super Admin can inspect receipts belonging to the company
- Company Analytics — appointment / customer / professional / receipt activity
- Company Activity — important company events displayed chronologically

7.8 Suspend / Reactivate Company

Suspend

Company Details → Suspend Company → Enter Reason → Confirm → Status = Suspended

The suspension event should be recorded in the audit log.

Reactivate

Suspended Company → Reactivate → Confirm → Status = Active

7.9 Global Users

The Users module provides a global directory of TIMEORA users: Customers, Professionals/Staff, Company Admins.

Functions: Search, Filter by role, Filter by company, View user, View account status, View associated company.

Detailed operational information remains in the relevant dedicated module.

7.10 Customers

The global Customers module displays: Customer name, Email, Phone, Status, Registration date, Appointment count.

Super Admin can: Search, Filter, View customer, View appointment history, View associated companies, View account status.

7.11 Professionals / Staff

The global Professionals module displays: Professional name, Company, Profession, Status, Appointment count.

Super Admin can: Search, Filter, View professional, View company, View appointment activity, View account status.

Super Admin does not manage professional schedules or availability.

7.12 Services & Categories

The Super Admin manages the global category structure (e.g. Healthcare, Beauty, Fitness, Education, Consulting).

Super Admin actions: Create category, Edit category, View category, Disable category.

Layer	Owner
Global Categories / Structure	Super Admin
Company's Actual Services (creation, price, configuration, professional assignment, availability)	Company Admin

7.13 Global Appointments

Platform-wide appointment monitoring.

Appointment information: Appointment ID, Customer, Company, Professional, Service, Date, Time, Status, Payment status.

Filters: Company, Customer, Professional, Service, Date, Appointment status.

Super Admin's role here is primarily monitoring and inspection, not day-to-day appointment operation.

7.14 Receipts

Receipts are a dedicated Super Admin module.

Receipt information: Receipt number, Appointment ID, Customer, Company, Professional, Service, Appointment date, Amount, Payment method, Payment status, Generated/paid date.

Payment status: Unpaid, Paid. **Payment method:** Cash on Reception.

7.15 Reports & Analytics

Reports provide deeper analysis than the dashboard.

- Company Reports — registrations, active companies, suspended companies, company growth
- Customer Reports — customer growth, active customers, customer activity
- Appointment Reports — appointment volume, completion rate, cancellation rate, booking trends, no-show trends
- Receipt Reports — receipts generated, paid receipts, unpaid receipts

Filters: Today, This week, This month, This year, Custom date range.

Export: CSV, Excel, PDF.

7.16 Platform Settings

General

- TIMEORA name
- Logo
- Platform email
- Contact information

Booking / Notifications / System

- Global booking configuration
- Email / SMS / Push notification toggles
- Default timezone
- Default currency
- Maintenance configuration
- Other global settings

Company-specific configuration remains under Company Admin.

7.17 System Notifications

Super Admin can send platform-wide announcements to: All companies, Selected companies, Company Admins, Professionals, Customers.

Channels (depending on implementation): In-app, Email, Push, SMS.

These are separate from automatic appointment notifications.

7.18 Audit Logs

Audit Logs provide a record of who performed what action, on which target, and when.

Log information: Actor, Role, Action, Target, Timestamp, Previous value (where applicable), New value (where applicable).

Examples:

- Super Admin → Suspended Company → ABC Clinic
- Company Admin → Added Professional → Dr. Ahmed
- Company Admin → Created Service → Consultation
- Customer → Created Booking Request → APT-1001
- Staff → Accepted Booking → APT-1001
- System → Generated Receipt → REC-1001

Audit logs are read-only from the Super Admin interface.

7.19 Super Admin Navigation

```

SUPER ADMIN
├── Dashboard
├── Companies — Company Details
├── Users
├── Customers
├── Professionals / Staff
├── Services / Categories
├── Appointments
├── Receipts
├── Reports & Analytics
├── Platform Settings
├── System Notifications
└── Audit Logs

```

7.20 Super Admin Responsibility Boundary

Role	Primary Responsibility
Super Admin	Manage and monitor TIMEORA platform
Company Admin	Manage and operate individual company
Professional / Staff	Manage assigned appointments and provide services
Customer	Discover professionals and request/book appointments

8. Availability & Scheduling

8.1 Scheduling Architecture

TIMEORA uses a fixed one-hour appointment slot system for V1.

Core Rule: every appointment occupies exactly one 1-hour slot. There is no variable 30/45/90-minute scheduling logic in V1.

8.2 Company Working Hours

Company Admin defines the company's recurring operating schedule.

Day	Working Hours
Monday	09:00–17:00
Tuesday	09:00–17:00
Wednesday	09:00–17:00
Thursday	09:00–17:00
Friday	09:00–13:00
Saturday	10:00–14:00
Sunday	Closed

Company schedule defines the maximum operating window.

8.3 Professional Working Hours

Each professional can have an individual schedule within the company's operating hours.

Example: Company 09:00–17:00; Professional A 10:00–16:00; Professional B 09:00–14:00; Professional C 12:00–17:00.

Availability is therefore calculated individually for every professional.

8.4 Fixed One-Hour Slots

A professional working from 09:00 to 17:00 has:

- 09:00–10:00
- 10:00–11:00
- 11:00–12:00
- 12:00–13:00
- 13:00–14:00
- 14:00–15:00
- 15:00–16:00
- 16:00–17:00

Each slot can be: Available, Booked, Pending/Reserved, Blocked, Break, Unavailable.

8.5 Service Duration

For V1: every bookable service consumes exactly one one-hour slot. Service duration is standardized to 60 minutes.

Variable duration is intentionally excluded from V1 to keep the scheduling engine simple and reliable.

8.6 Availability Calculation

Professional availability is determined using:

```
Company Working Hours + Professional Working Hours + Recurring Schedule
+ Schedule Exceptions + Breaks + Blocked Time + Existing Appointments + Service Eligibility
↓
Final Available Slots
```

8.7 Breaks

Breaks make corresponding slots unavailable.

Example: Professional 09:00–17:00, Break 13:00–14:00 → the 13:00–14:00 slot is unavailable.

For V1, breaks should follow the same one-hour slot structure.

8.8 Company Holidays

A company holiday makes the company unavailable for appointments.

Example: 14 August → Company Closed. All affected professionals become unavailable for that date unless an explicitly supported exception overrides the closure.

8.9 Professional Days Off

A professional may have an individual day off while the company remains open.

Example: Company → Open; Dr. Ahmed → Day Off. Only Dr. Ahmed's availability is affected.

8.10 Blocked Time

Authorized company users can block professional slots for: Meetings, Personal time, Training, Maintenance, Emergency situations, Internal work.

Blocked slots cannot be booked by customers.

8.11 Schedule Exceptions

Recurring schedules can be overridden for specific dates.

Exception types: Full-day leave, Modified working hours, Blocked slot, Holiday, Special working day.

Example: regular schedule Monday → 09:00–17:00; exception 24 August → 12:00–17:00 unavailable. The recurring schedule remains unchanged.

8.12 Multiple Professional Availability

When a service is provided by multiple professionals, TIMEORA can display availability across eligible professionals.

Example: Consultation — Dr. Ahmed (Booked), Dr. Sara (Available), Dr. Ali (Available).

If the customer specifically selects Dr. Sara, the appointment belongs to Dr. Sara. If “Any Available Professional” is supported, TIMEORA can assign an eligible available professional.

8.13 Double-Booking Prevention

Availability must be validated by the backend when a booking request is submitted.

```
Customer selects 10:00–11:00
↓
Frontend displays slot as available
↓
Customer submits booking request
↓
Backend rechecks availability
↓
Slot available? YES → Create Pending Request | NO → Reject Request
```

This prevents concurrent requests from creating conflicting bookings.

8.14 Pending Slot Protection

A slot with an active pending request should not be offered to another customer until the request is resolved according to the system's reservation policy. If the request is rejected or expires according to the implemented policy, the slot becomes available again.

8.15 Timezone

For V1, each company operates using a single configured timezone, e.g. Asia/Karachi. Company and professional schedules are interpreted using the company's timezone. This avoids unnecessary complexity from allowing different timezones for individual professionals.

8.16 Recurring Schedules

Both company and professional schedules support recurring weekly patterns.

Day	Hours
Monday	09:00–17:00
Tuesday	09:00–17:00
Wednesday	09:00–17:00
Thursday	09:00–17:00
Friday	09:00–13:00
Saturday	10:00–14:00
Sunday	Closed

The system applies the schedule automatically to future dates.

8.17 Final Availability Algorithm

Company Schedule → Professional Schedule → Recurring Schedule → Schedule Exceptions
→ Breaks / Blocked Time → Existing Confirmed Appointments → Pending Booking Protection
→ Professional-Service Eligibility → Generate / Validate 1-Hour Slots → Backend Availability Check
→ Display Available Slots

Final Rule: TIMEORA V1 uses fixed 1-hour appointment slots. No variable service durations or custom slot intervals are required in V1.

9. Payment & Receipt

9.1 Payment Architecture

TIMEORA V1 uses Cash on Reception. There is no online payment processing.

Appointment Confirmed → Payment Status = Unpaid → Customer Arrives
 → Cash Received at Reception → Authorized User Marks Payment as Paid
 → Payment Record Created → Receipt Generated → Receipt Available for View/Download/Print

9.2 Payment Status

For V1, only two payment statuses are required: Unpaid, Paid. Refunded payments are outside the current V1 scope.

9.3 Cash Payment Recording

Payment is collected physically at the company reception. An authorized user opens the appointment and records the payment.

The system records: Amount, Payment method = Cash, Payment date/time, User who recorded the payment.

9.4 Payment Permissions

Only authorized company-side users should be able to mark a payment as Paid.

Recommended V1 permission: Company Admin, Authorized Reception/Company Staff.

The following should not be able to mark payments as Paid: Customer, Regular Professional/Staff without payment permission, Super Admin as part of normal company operations.

Super Admin can monitor payment records at platform level.

9.5 Payment Confirmation

Before recording payment, the system displays a confirmation dialog.

Confirm cash payment of Rs. 2,000?

After confirmation: payment status → Paid, payment record created, receipt generated, payment history updated.

9.6 Receipt Generation

Once payment is successfully marked as Paid, TIMEORA generates the receipt.

Receipt information — Company: name, logo (if available), address, contact information.

Receipt: receipt number, payment date/time, appointment ID.

Customer: customer name, contact information.

Appointment: service, professional, appointment date, appointment time, duration.

Payment: amount, payment method (Cash), payment status (Paid).

9.7 Receipt Example

TIMEORA – Appointment Payment Receipt

Receipt No: REC-00125	Appointment ID: APT-1025
Customer: Ali Khan	Company: ABC Clinic
Professional: Dr. Ahmed	Service: Consultation
Date: 25 August 2026	Time: 10:00 AM – 11:00 AM
Amount: Rs. 2,000	Payment Method: Cash
Payment Status: Paid	Paid At: 25 August 2026, 9:55 AM

The receipt should support: **View, Download, Print.**

9.8 Payment History

Each company maintains a payment history.

Field	Description
Receipt Number	Unique receipt identifier
Appointment ID	Related appointment
Customer	Customer who made payment
Company	Receiving company
Professional	Assigned professional
Service	Booked service
Amount	Amount received
Payment Method	Cash
Payment Status	Paid/Unpaid
Paid At	Payment date/time
Received By	Authorized user

Filters: Date, Customer, Professional, Payment status, Receipt number, Appointment.

9.9 Payment & Receipt Responsibility

Role	Can
Customer	View payment status, view receipt, download receipt, print receipt
Company Admin / Authorized Reception Staff	Receive cash, mark payment as Paid, view payment history, view/generate receipts
Professional	View payment status where permitted; does not automatically receive payment-recording authority
Super Admin	Monitor payment records, view receipts, view payment statistics, include receipt/payment activity in platform reports

Super Admin does not collect or process company payments.

9.10 Payment Scope — V1

The following are explicitly not included:

- Stripe
- PayPal
- JazzCash integration
- Easypaisa integration
- Credit/debit card processing
- Online payment gateway
- Online checkout
- Online refunds
- TIMEORA platform revenue
- Subscription revenue

The architecture can be extended later if online payments are introduced.

10. Final TIMEORA Core Flows

10.1 Customer Booking Flow

Customer Registration / Login → Customer Dashboard → Search Professionals / Services
 → Select Professional → View Professional Profile → Select Service → Select Date
 → Select Available 1-Hour Slot → Submit Booking Request → Appointment = Pending
 ↓
 Staff Reviews Request
 └─ Accept → Confirmed → Calendar Updated → Customer Notified
 └─ Reject → Rejected
 ↓
 Appointment Day → Checked-in → In Progress → Completed
 ↓
 Cash Payment at Reception → Payment = Paid → Receipt Generated

10.2 Cross-Portal Booking Flow

CUSTOMER → Booking Request → APPOINTMENT
 ↓
 CUSTOMER PORTAL → My Appointment
 COMPANY PORTAL → Bookings
 PROFESSIONAL PORTAL → My Appointments

One central appointment record powers all three operational views.

10.3 Availability Flow

Company Working Hours → Professional Working Hours → Recurring Schedule → Schedule Exceptions
 → Breaks / Blocked Time → Existing Appointments → Pending Requests → Service Eligibility
 → 1-Hour Slot Validation → Available Slots → Customer Booking Request

10.4 Payment Flow

Appointment Confirmed → Payment = Unpaid → Customer Arrives → Cash Received
 → Authorized User Confirms Payment → Payment = Paid → Payment Record Created
 → Receipt Generated → Customer Can View / Download / Print

11. Final Architectural Principles

These are treated as the core rules of the TIMEORA V1 system:

- Customers can publicly register.
- Customer and Company users share the same login interface.
- Super Admin uses a private login.
- Customers are global TIMEORA users and are not tied to one company.
- Professionals belong to companies.
- A professional card always identifies its associated company.
- Customers can book directly through a professional.
- The company is automatically identified from the selected professional.
- Every appointment belongs to one customer, one company, one professional, and one service.
- Every appointment occupies exactly one hour in V1.
- Booking requests are not immediately confirmed.
- Professional/Staff acceptance confirms the appointment.
- Pending requests must be protected against double booking.
- Confirmed appointments update the professional, company, and customer portals.
- Availability is calculated dynamically from schedules, exceptions, breaks, blocked periods, pending requests, and existing appointments.
- Payment is Cash on Reception only.
- Appointment confirmation initially creates an Unpaid payment state.
- An authorized company-side user records the cash payment.
- Receipt generation occurs after payment is successfully marked Paid.
- Super Admin monitors TIMEORA globally but does not operate individual companies.
- Company Admin manages company operations.
- Professionals manage their assigned appointments and service delivery.
- Customers discover professionals and manage their appointments.
- No online payment gateway, subscriptions, platform revenue, or AI insights are included in V1.

12. Notifications

Since roles, booking flow, cash payment, 1-hour slots, and panels are already finalized, Notifications is designed as a controlled system rather than notifying everyone about everything.

12.1 Appointment Notifications

Important booking flow: Customer books → Staff receives notification → Staff accepts → Customer receives confirmation → appointment appears on calendar. “Appointment booked” and “Appointment confirmed” are treated as separate events.

Event	Customer	Staff	Company
Appointment booked/requested	✓	✓	✓
Appointment confirmed	✓	✓	✓
Appointment rescheduled	✓	✓	✓
Appointment cancelled	✓	✓	✓
Appointment reminder	✓	✓	Optional
Appointment completed	✓	✓	✓

12.2 Appointment Reminder

Since every appointment is 1 hour, reminders are kept simple:

- 24 hours before: reminder
- 1 hour before: reminder

Both are sent to Customer and Staff. This prevents unnecessary notification spam.

12.3 Appointment Cancellation

Customer cancels → Staff + Company notified → Customer gets cancellation confirmation.

Staff/Company cancels → Customer notified → Staff/Company gets appropriate internal notification.

The notification should contain: Customer name, Staff name, Service, Date, Time, Cancellation reason (if provided).

12.4 Appointment Rescheduling

When an appointment is rescheduled, Customer, Staff, and Company are all notified. The notification should show the Old date/time and New date/time — important because the calendar and available slots are recalculated after rescheduling.

12.5 Account Verification

Customer registration → verification email. Company registration → verification email. Staff invitation/account activation → account setup/verification email. For security-related actions, email is the primary channel.

12.6 System Announcements

These are Super Admin controlled, e.g. “System maintenance scheduled for Sunday.” Super Admin can create an announcement and select the target: All users, Customers, Companies, Staff.

System announcements support: In-app (always), Email (optional/important announcements only). Don't email every minor announcement.

12.7 Channels — Final Decision

In-App Notifications

Used for almost all operational events: appointment booked, confirmed, rescheduled, cancelled, reminder, completed; staff invitation; customer invitation; system announcements. Each panel gets its own notification center.

Customer Panel – “Appointment with Dr. Ahmed confirmed for Aug 25 at 3:00 PM.”

Staff Panel – “New appointment request from Maryam for Aug 25 at 3:00 PM.”

Company Panel – “Appointment confirmed by Staff Member Ahmed.”

Email Notifications

Used for events where the user should receive something even when they're not inside the system: account verification, appointment confirmation, rescheduling, cancellation, reminders, staff invitation, customer invitation, important system announcements.

12.8 Final Notification Matrix

Notification	In-App	Email
Appointment booked/requested	✓	✗
Appointment confirmed	✓	✓
Appointment rescheduled	✓	✓
Appointment cancelled	✓	✓
24h reminder	✓	✓
1h reminder	✓	✓
Appointment completed	✓	✗
Staff invitation	✓	✓
Customer invitation	✓	✓
Account verification	✗	✓
System announcement	✓	Optional

Why does “booked” not get an email? Because booking is initially a request to staff, not a confirmed appointment. The important customer-facing email should come when the staff accepts/confirms it.

12.9 Notification Center

Every role has a notification icon.

- Customer — all notifications, unread/read, appointment-related notifications
- Staff — new booking requests, confirmations, changes, reminders, cancellations
- Company — booking activity, staff activity, customer activity, important system notifications
- Super Admin — system-level notifications, important platform events, announcements

Includes: unread count, mark as read, mark all as read, notification timestamp, click notification → relevant page.

12.10 Notification Settings

Part of Settings for each panel. Users can control email notifications such as:

- Appointment confirmations ON/OFF
- Appointment reminders ON/OFF
- Rescheduling ON/OFF
- Cancellations ON/OFF
- System announcements ON/OFF

Some notifications should not be disabled, especially: Account verification, Security/account-related emails.

12.11 Finalized Notification System

Events: Appointment booked/requested, Appointment confirmed, Appointment rescheduled, Appointment cancelled, Appointment reminder (24h + 1h), Appointment completed, Staff invitation, Customer invitation, Account verification, System announcements.

Channels: In-app, Email.

Core rule: Operational activity → In-app + selected important emails. Account/security → Email. System announcements → In-app, with email only for important announcements.

13. User & Role Permissions

This is different from the panels themselves. One final permission matrix defines exactly what each role can View, Create, Edit, Delete, Approve, Cancel, Reschedule, and Manage.

Feature	Super Admin	Company	Staff	Customer
Companies	✓ All	Own only	✗	View
Staff	All	Own	Own profile	View
Customers	All	Own	Assigned	Own
Appointments	All	Own	Assigned	Own
Services	All	Own	View	View
Payments	All	Own	Mark cash	View own
Reports	Platform	Own	Own	Own
Settings	Platform	Own	Personal	Personal

14. Final Tech Stack

TIMEORA's technology stack is officially Laravel-based. Since the pages, roles, booking flow, scheduling, payment, and notifications are already finalized, this stack is sufficient for the complete system.

14.1 Stack Overview

Layer	Technology
Frontend	React.js
Styling / UI	Tailwind CSS
Backend	Laravel
Backend Language	PHP
Database	MySQL
ORM	Laravel Eloquent ORM
API	Laravel REST API
Authentication	Laravel Sanctum
Authorization	Laravel Middleware + Policies
Validation	Laravel Form Requests
Notifications	Laravel Notifications
Email	Laravel Mail
Background Jobs	Laravel Queues
Scheduled Tasks	Laravel Scheduler
Receipt Generation	Laravel PDF library
Calendar	React Calendar library
API Communication	Axios
Frontend Routing	React Router
State Management	React Context / Hooks
Database Migrations	Laravel Migrations
Testing	PHPUnit / Pest + Laravel Feature Tests
Version Control	Git
Repository	GitHub

14.2 Overall Architecture

TIMEORA

- FRONTEND — React.js / Tailwind CSS / React Router / Axios
- BACKEND — Laravel / PHP + Eloquent / REST API / Sanctum

↓
MySQL

14.3 Frontend

React.js, with React Router, Axios, Tailwind CSS, Context API, React Hooks, and a Calendar library.

React handles: customer dashboard, company dashboard, staff dashboard, Super Admin dashboard, booking UI, calendar UI, appointment management, forms, tables, modals, notifications UI.

14.4 Backend

Laravel handles the actual business logic, while React handles the UI. Modules include: Authentication, Authorization, Users, Companies, Staff, Services, Availability, Appointments, Booking Requests, Payments, Receipts, Notifications, Reminders, Reports.

14.5 Database

MySQL + Eloquent. Main entities will be approximately: users, companies, staff, customers, services, staff_services, availability, appointments, payments, receipts, notifications. The exact database schema is finalized during the database-design phase.

14.6 Authentication & Authorization

Laravel Sanctum with role-based access:

Super Admin → Full System Access
Company → Company Management + Staff Management
Staff → Own Appointments / Availability
Customer → Booking / Appointments

14.7 Booking & Scheduling

Customer → Select Company → Select Service → Select Staff → Select Available 1-hour Slot
→ Booking Request → Staff Accepts → Appointment Confirmed → Calendar Updated → Remaining Slots Recalculated

React displays the calendar and available slots; Laravel is responsible for making sure the booking rules are actually enforced.

14.8 Payment

As finalized: Cash on Reception. No Stripe, PayPal, or other online payment gateway.

Appointment → Payment Status → Unpaid → Customer arrives → Cash received → Staff/Company marks Paid → Receipt generated

14.9 Notifications & Automated Tasks

Laravel Notifications handle: appointment booked, confirmed, rescheduled, cancelled, reminder, completed; staff invitation; customer invitation; account verification; system announcements.

Laravel Scheduler + Queues handle automated tasks such as appointment reminders (check upcoming appointments → send notification), keeping these operations out of the React frontend.

14.10 Final Stack — Locked

Layer	Choice
Frontend	React.js + Tailwind CSS + React Router + Axios + Context API
Backend	Laravel + PHP + REST API + Eloquent ORM
Database	MySQL
Authentication	Laravel Sanctum
Authorization	Middleware + Policies
Notifications	Laravel Notifications + Mail
Background Processing	Laravel Queues + Scheduler
Payments	Cash on Reception
Receipts	Laravel PDF generation
Calendar	React Calendar Library
Testing	Pest/PHPUnit + Laravel Feature Tests
Version Control	Git + GitHub

Not used in TIMEORA: Node.js (as a backend runtime), Express.js, Prisma, MongoDB, or any online payment gateway.

The core stack is officially: React + Tailwind CSS + Laravel + PHP + MySQL + Eloquent + Sanctum.
